AB The title filtering elements are made from polyimide fibers, and have heat-resistant temperature ≥280°. The filtering elements are integrated self-supportable hollow articles having plural 1 side-opened tube-like hollow cells arranged in a plane. The filtering elements are manufactured by oppositely matching the indented portions of 2 corrugated filter sheets to form the tube-like hollow cells, and hot pressing by a pair of molds having the same corrugated shape at 250-430°and 0.03-2.0 kg/cm2. Large filtering area per each filtering element is obtained.

AB The title compns. with good low temperature punching properties contain benzoguanamine (I)-modified phenolic resins, phosphates, and phthalates. Thus, I 187, PhOH 113, and 37% formalin 349 g were stirred in the presence of EtNH2 at 90° for 4 h to give a modified phenolic resin, 65 parts of which was mixed with cresyl di-Ph phosphate 25, dioctyl phthalate 5, and tetrabromobisphenol A 5 parts to give a composition Then, several pieces of kraft paper were impregnated with the composition at 50% resin impregnation to give processed paper, 8 pieces of which were laminated and bonded with a 35-μm Cu foil to give a 1.6-mm Cu-covered laminate, which showed good punching properties at 20°, UL-94 inflammability V-0, and insulation resistance 2.1 + 108 Ω.

AB JP 07000730 A UPAB: 19950322
    Multiple hollow filter elements arranged on a plane are characterised in that they consist of multiple long tubular hollow cells which are open at one end, made of heat-resisting polyimide fibres, thermally resistant at 280 deg. C or higher, and integrated into a self-standing rigid structure arranged on a plane.

    Also claimed is the preparation of the above-claimed multiple hollow filter elements, in which a sheet of heat-resisting polyimide fibre felt is placed on top of another, the two sheets are bonded together longitudinally so that they form multiple long tubular cells which are open at one end, closed at the other end, and arranged into a planar structure, metallic tubular supports with a desired cross-sectional shape are inserted into the cells from the open ends to support the cells, the felt sheets are held between a pair of top and bottom metallic fixtures with a concave contacting shape which fits the convex shape of the felt sheets formed by the inserted metallic tubular supports, and the felt sheets and metallic fixtures are formed into a product under pressure and heat.

    USE/ADVANTAGE - The multiple hollow filter elements arranged on a plane can be used to collect dust and other particulates from exhaust gas emitted from incinerators. Since the filter elements are self-standing, no retainers are necessary. The filtration area per element is large.

AB PURPOSE: To provide a filter element dispensing with a retainer, being an independent type, wide in the filtration area of one element and capable of easily producing a uniform shaped product.
    CONSTITUTION: A planar array multiple hollow body filter element 1 is composed of plural vertically long and one side opened tubular type hollow body cells made of high heat resistant polyimide fiber, having >=280°C heat resistant temperature and having a rigid horizontally single line planar array structure in one body so as to be independent and the hollow body filter element is produced by using a felt sheet made of the polyimide fiber as a raw material and air permeable molding. The filter element provided with a can body mounting member is preferable.
